

Gum lift Gingivectomy

General Information

Gum lift is a procedure whereby a laser tip is used to re-sculpt the tissues. The purpose of this procedure is to show more tooth and reduce gum display or “gummy smile”. This is a relatively easy procedure with instant results.

Candidates for a gum lift

The ideal candidate for a gum lift would be somebody that has a very “gummy” smile, or somebody that has an uneven gum line.

What to expect

Post operatively the gum may feel discomfort for a day or two. It can be managed with warm salt water rinses morning and night

Some gums are stubborn and will regrow, on some patients a few sessions a couple months apart are needed to effectively reshape the gums. We advise you to brush the gums in an upward direction to help maintain the gum lift.
